

Laboratory Assessment: Reflection

In one short paragraph, how did you develop and verify your solution to one quick activity, and how did organizing and committing your files help you document your work?

I developed my solution by first understanding the problem, identifying the inputs, processes, and outputs, and then creating the pseudocode and calculations step by step. I verified my solution by doing a dry run using the given test cases and checking if the results were correct. Organizing my files and committing them helped me keep track of my work, see the changes I made, and make sure my final solution was properly documented and easy to review.
